

NOTES:

- AccountManager holds credential data for each user and is responsible for authentication when calling proxyView, add/remove Wallet, manageCredentials, ...
- Each chain type (EVM, substrate, ...) has its own account contract (per user). Inside each account contract there may be up to 100 wallets of corresponding type
- proxyView is a view function that generates signed transaction in behalf of any wallet available inside Account contract. It requires authentication data (keypass or password) to unlock functions inside Account contract.
